Issue Date	25th March 2021		
Version	2.0		
Summary of Changes from Previous Version	New emphasis on informed consent and update around peri-operative management as per Guideline written by Association of Anaesthetists published on July 2018.		
Supersedes	v1.0, Issued 6th February 2018 to Review Date April 2021 (ext[1])		
Document Category	Clinical		
Consultation Undertaken	Hospital Transfusion Committee Hospital Consent Group Trust Solicitor		
Date of Completion of Equality Impact Assessment	30th July 2020		
Date of Environmental Impact Assessment (if applicable	N/A		
Legal and/or Accreditation Implications	To be confirmed		
Target Audience	All staff who treat patients who may refuse a blood or blood component transfusion and Blood bank staff		
Review Date	January 2024		
Sponsor (Position)	Medical Director		
Author (Position & Name)	Dr Swe Win Maung, Consultant Anaesthetist (on behalf of Hospital Transfusion Committee Chair)		
Lead Division/ Directorate	Surgery		
Lead Specialty/ Service/ Department	Critical Care		
Position of Person able to provide Further Guidance/Information	Hospital Transfusion Committee Chair, Dr Lisa Milliagan		

Associated Documents/ Information	**Date Associated Documents/ Information was reviewed**
None	None
Template control	June 2020

CONTENTS

1.0 INTRODUCTION

Every competent adult patient is entitled to refuse to consent to medical treatment for good reason, bad reason or no reason (1). The Mental Capacity Act (2005) formalises, in law, the right of people with capacity to define in advance which medical treatments that they will and will not consent to at a time when they have become incapable of making and communicating a decision.

A fundamental belief of the Jehovah's Witness Christian movement is the rejection of transfusions of whole blood, or any of its four primary components, namely, red cells, plasma, platelets and white cells. Fractions of any of the four primary components may be acceptable but are a matter of individual patient choice.

Patients who decline treatment using blood components or products remain entitled to the highest standards of medical care and full use of modern medical technology (2).

When agreement cannot be reached between the doctor and the patient, referral for a second opinion should be considered. When the patient is a child, the same strategy should be used but on occasion the clinical team may have to obtain legal help.

2.0 POLICY STATEMENT

In order to ensure a high standard of medical care it is essential that individual cases are reviewed in a timely way by consultant leads for the speciality, haematology and anaesthesia. This policy describes the standards in practice required and applies to:

Staff group(s)

- all staff who treat patients who may refuse a blood or blood component transfusion
- Blood bank staff

Clinical area(s)

- All clinical areas
- Blood bank

Patient group(s)

- All patients who refuse the administration of blood or blood components (see section 5 regarding paediatric patients)

Exclusions

- All patients who consent to the administration of blood or blood components (see section 5 regarding paediatric patients)

The policy should be read in conjunction with the Code of Conduct relevant to each professional body, i.e.

- The General Medical Council
- The Nursing and Midwifery Council
- The Health professions Council

3.0 DEFINITIONS/ ABBREVIATIONS

Trust	Sherwood Forest Hospitals NHS Foundation Trust
SFHT	Sherwood Forest Hospitals NHS Foundation Trust
Staff	All employers of the Trust including those managed by a third party on behalf of the Trust
ADRT*	Advance decision to refuse treatment
FBC	Full blood count
NSAID	Non-steroidal anti-inflammatory drug
MCA	Mental Capacity Act
HLC	(Jehovah's Witness) Hospital Liaison Committee
ODP	Operating department practitioner

***N.B. For the purpose of this document, where the wording "advance decision document" is used, this should also be taken to mean Living Will, Advance Directive, or Advance Statement. Good practice is now to refer to all advance statements to refuse treatment as "Advance Decisions Documents" in line with terminology in the Mental Capacity Act 2005.**

4.0 ROLES AND RESPONSIBILITIES

4.1 Medical Staff

- Medical staff are responsible for discussing the care and treatment options and transfusion alternatives with the patient.
- Medical staff are responsible for obtaining consent where the patient has capacity. This should involve the most senior doctor available, preferably a Consultant and ideally the Consultant responsible for the patient's care.
- The discussion and consent must be recorded in the patient health record. This must in turn be communicated to those delivering care to the patient, especially in the Operating Theatre or similar environment.
- Where the patient does not have capacity, but has an ADRT (advance decision to refuse treatment), this must be respected and communicated to all members of the care team and documented in the patient health record.
- In the case of Jehovah's Witness patients, medical staff have a responsibility to ensure that the Local Hospital Liaison Group (HLC,) where relevant, is involved in all discussions and documentation.
- Medical staff have the right to refuse to treat patients in elective situations, but should attempt to refer to suitably qualified colleagues who are prepared to undertake treatment. In an emergency medical staff are obliged to provide care and must respect the patient's competently expressed views (1).

4.2 Consultant Haematologists

The haematology medical team, led by the Consultant Haematologists, will provide support for the clinical teams involved in caring for patients who may refuse transfusion.

4.3 Registered nurse / midwife, Registered Operating Department Practitioners (ODPs), healthcare assistants

All staff are responsible for:

- Ensuring that the beliefs and concerns of any patient who refuses transfusion of blood components or products, and/or their derivatives, are acknowledged and respected at all times.
- Complying with the Policy and bringing to the attention of their immediate manager any difficulties they encounter using this policy.
- Ensuring a patient's decision is communicated to all relevant staff & recorded in the patient's health records. This is particularly important when transferring patients for invasive procedures (e.g. Operating Theatres).
- Ensuring that they can provide information and contact details of local Jehovah's Witness HLC.

4.4 Laboratory (Blood Bank) staff

Laboratory staff are responsible for annotating the patient's record on Winpath with a comment indicating "no blood products"

4.5 The Hospital Liaison Committee

The local Jehovah's Witness Hospital Liaison Committee (HLC) will give advice regarding transfusion issues for Jehovah's Witness patients. Their aim is to support the patient and doctor, assisting understanding on both sides avoid confrontation and to help find alternative treatment options (See appendix 1 for treatment options).

4.6 Trust Solicitor

The Trust Solicitor can be contacted over 24/7 via switchboard and will advise regarding treatment decisions, where there are issues regarding consent, particularly with the care of children.

4.7 Hospital Transfusion Committee

The Hospital Transfusion Committee is responsible for the development and management of the policy.

5.0 APPROVAL

Following consultation this policy (v2.0) has been approved by the Trust's Hospital Transfusion Committee.

6.0 DOCUMENT REQUIREMENTS (NARRATIVE)

6.1 Consent and legal matters

6.1.1 Adults (18 years and older)

Any competent adult patient, including those who are Jehovah's Witnesses, is entitled to refuse any aspect of medical treatment. They can consent to a surgery but exclude specifically certain aspects of management, such as a blood transfusion. Many Jehovah's Witness patients will carry an "Advance Directive" document detailing which blood components/products, derivatives and techniques they refuse to accept. Such documents, if properly signed and witnessed, should be respected unless there is some reason to think the patient may have changed their views since the directive was executed. To transfuse a patient who has steadfastly refused to accept it either by the provision of an advance directive or by its exclusion in a consent form is unlawful, ethically unacceptable and may lead to criminal and/or civil proceedings.

A patient does not need to give a reason for refusing consent, but where refusal may lead to a loss of life or serious harm; it is good practice to ensure that there is specific documentation, both of the fact of refusal and of the patient's awareness of its potential consequences. The Doctor should also consider whether there is any indication that the patient's refusal is the result of coercion or undue pressure from any other person. However, they should equally be careful not to seek to influence a patient to take a course of action which is not in keeping with the patient's wishes and values. The anaesthetic induction room or the operating theatre is not the appropriate venue for discussing consent in the elective situation.

In an emergency, the clinician is obliged to provide care and must respect the patient's competently expressed views.

Where adult patients lack capacity to decide for themselves (for example, the patient is unconscious following a head injury or severe trauma, or they are sedated in intensive care), an assessment of the benefits, burdens and risks, and the acceptability of proposed treatment must be made in their behalf by the doctor, taking into account of their wishes, where they are known. This cannot be done effectively without information about the patient which those close to the patient will be best placed to know (9). Therefore, if time permits the views of the patient's relatives or representatives should be taken into consideration. Relatives must be invited to produce evidence of an advance directive to refuse treatment. Many Jehovah's Witness patients will have previously lodged a copy of an advance directive with their GP, so if time permits, they should be contacted.

A previously completed, SFHT 'Checklist for patients refusing blood and blood components' (appendix 3) may be used to help identify the patient's wishes, however this will depend upon the circumstances, such as time interval since it was completed. In such circumstances, this document would not be binding.

If the healthcare personnel are satisfied that an advance decision is valid and applies to the proposed treatment, they would not be protected from liability if they then give a treatment which goes against the documented advance decision. However, they would be protected from liability if they did not know about an advance decision, or they are not satisfied that the advance decision is valid and applies in the current circumstances (4)

Where a patient's wishes are not known it is the doctor's responsibility to decide what is in the patient's best interests and this may include the transfusion of blood components/products if this is considered to be life-saving.

In the case of emergency patients identified as Jehovah's Witnesses but *without documentation*, every effort should be made to avoid the use of blood and blood products in the perioperative period. However, in serious or life-threatening situations the use of blood and blood products should be based on the judgement of the clinician responsible for the patient. (11)

Where a patient's wishes are not known it is the doctor's responsibility to decide what is in the patient's best interests and this may include the transfusion of blood components/products if this is considered to be life-saving.

6.1.2 Children

Young adults of sound mind aged 16-18 years have a statutory right in England and Wales to consent to procedures on their own account and there is no legal requirement to obtain additional consent from a parent or guardian. The patient's consent takes precedence over parental objections; however, the law expressly states that this does not invalidate the right of others to consent on their behalf. If the patient is in an acute emergency situation it will be lawful to proceed on the basis of the consent of either parent. Where time permits, the court should be asked to resolve the position (2, 5, 8).

In England and Wales children younger than 16 years may be competent to give their own consent if they demonstrate a clear grasp of the proposed treatment and the risks, benefits or consequences of acceptance or rejection of a proposed treatment. This is referred to as 'Gillick-competence'. However, this is likely only to apply to children above the age of 12 years, but could for more minor procedures apply much younger.

Even though a child of 16 or 17 may give consent to medical treatment, his refusal will not be binding. If the treatment is in the child's 'best interests' such a refusal may be over-ridden by someone with parental responsibility or by the Court. Should a child under 16 refuse to consent this may still be over-ridden by anyone with parental responsibility. However practitioners will often wish to obtain a court order before seeking to impose medical treatment on an unwilling teenager solely on the basis of parental consent (9).

A situation could be envisaged where a child under the age of 16 years consented to an elective blood transfusion in the face of parental opposition. Consent in this situation would be sound provided that the child could show evidence of 'Gillick competence'. Although those with parental responsibility can give consent to treatment on a child's behalf they cannot veto treatment if it is in the child's best interests. It may be necessary to treat a child against his parents' wishes. In such circumstances, and if time permits, a Court declaration should be sought as to the child's best interests (9). In an emergency situation where there is no time to apply to Court any doubts should be resolved in favour of the preservation of life (6,7,9).

If the family are Jehovah's Witnesses, the Jehovah's Witness Hospital Liaison Committee is available to help with advice and guidance. These discussions along with the parents at ward level can often resolve difficulties and avoid costly court referral. Doctors have a legal and ethical responsibility to ensure the wellbeing of the child under their care and this must always be their first consideration; however, every effort must be made to respect the beliefs of the family and avoid the use of blood or blood products wherever possible (11).

Further advice in a situation which is proving challenging can be obtained from the Jehovah Witnesses as they have an international database of clinicians that can offer advice.
Contact details for Hospital Information Desk, Great Britain and Ireland headquarters: daytime telephone: 020 8371 3415 (24 h service); email: hid.gb@jw.org. International details: https://www.jw.org/en/medical-library/hospital-liaison-committee-hlc-contacts.

6.2 Care Planning

When a patient refusing blood and blood components presents for treatment, the staff responsible will discuss with them their treatment choices. This will include a plan of care and treatment by consultants and nursing/midwifery staff, which will be communicated to all clinical staff likely to be involved in the treatment of the patient.

Alternative treatment modalities that are available, in particular, interventional or surgical procedures known to be associated with comparatively low blood loss, should be offered e.g. Cell salvage. Cell salvage can be set up as a 'closed system' if the witness requests (a continuous connection from the patient to the CS system and back to the patient)

Discussions will need to occur with service planners, and medical and theatre staff, when alternatives and cell salvage are to be used. This must be documented and communicated to all members of the Multi-Disciplinary Team.

In elective and urgent cases, when blood transfusions may be considered to be standard treatment, the following actions will be considered:

1. Review of non-blood transfusion alternatives.
2. Consultation with other doctors experienced in non-blood management and treatment without using allogeneic (homologous) blood.
3. Transfer of the patient's care to a doctor or to a facility willing to treat the patient without blood before the patient's condition deteriorates.
4. Given the difficulties which may arise during surgical or other invasive procedures, consideration should be given to such procedures being performed by Consultant grade staff.
5. Consult the local Hospital Liaison Committee (HLC) of Jehovah's Witnesses (if appropriate).

6.3 Clinical management of patients who refuse transfusion

- **Surgical patients**

6.3.1 Pre-operative preparation

A patient's views about blood and blood components/products should be sought as soon as the need for a procedure with an attendant risk of blood loss is identified. A full and frank discussion of the proposed treatment and its risks and benefits should take place. This must include the possibility that declining blood components/products could result in a threat to life or even death. This review should not, however, be intended to influence the patient to take a course of action that is not in keeping with their values and their wishes (11).

Those patients who refuse transfusion of blood and blood components/products should be identified as soon as possible (at the time of consent).

The treating Consultant must be made aware of the patient's decision at the earliest opportunity and the risks and benefits of the proposed intervention should be carefully evaluated. Non-surgical or less invasive treatment options should be considered.

Consultants from anaesthesia and haematology must be involved at the earliest opportunity, and a multi-disciplinary management plan should be formulated.

The patient should be given the opportunity to read the National Blood Service patient information booklets (Will I need a Blood Transfusion / Patient Blood Management) and also the SFHT Cell Salvage Patient Information Leaflet.

The patient's relatives and/or religious advisor should not be allowed to coerce or pressurise the patient into a particular course of action, or to impede discussion about the acceptability of certain treatments (2).

6.3.2 Pre – Operative Management Plan

Pre-operative assessment and relevant investigations should be carried out as early as possible. The patient's condition should be optimised where possible, especially with regard to haemoglobin level and cardio-respiratory fitness (appendix 4)

- Review of proposed date of surgery to enable time for effective preparation of the patient
- Consideration of non –surgical or less invasive treatment
- History of anaemia, bleeding disorders, renal/hepatic disease, and allergies should be specifically noted, including family history.
- Relevant investigations include: full blood count (FBC); B12 and folate; iron studies (ferritin and transferrin saturations); clotting screen; and fibrinogen At least 6 weeks before surgery (may not be possible in elective cancer surgery).
- If iron deficiency (absolute or functional), low iron stores or iron sequestration is diagnosed, iron treatment is indicated. Oral iron may be considered; in which case the patient's Hb should be re-checked 4 weeks after starting treatment.
- Results must be viewed by the pre-operative department nursing staff as soon as possible following initial patient contact
- Optimisation of the patient's pre-operative haemoglobin level if less than 130 g/l (see appendix 4)
- Assessment and optimisation of any anti-coagulant and anti-platelet medications, including: warfarin, heparins, other direct-acting oral anti-coagulants, aspirin, clopidogrel, NSAIDs, etc..
- Intra-operative cell salvage if appropriate-arrangements should be made to ensure that both a machine and trained operators are available on the day of surgery
- Advise on dietary intake

6.3.3 Documentation of treatment discussions

It is essential that treatment discussions are recorded in order that clear instructions are available in the event of an emergency situation where life sustaining treatment is required.

The SFHT 'Checklist for patients refusing blood and blood components' (appendix 3) must be completed, along with the SFHT consent form 1 (FKIN030290), including Section 16.

Originals must then be filed in the patient's medical record and a copy given to the patient. It is essential that patients complete the checklist and consent form with the speciality consultant in charge of their care.

A copy of this policy should also be printed out and filed in the patient's medical notes (at the front of the notes in the "Red Alert" section), so that it can be referred to at any time.

6.3.4 Advance Decisions

If presented by the patient, the Advance Decision to Refuse Treatment (ADTR) (Appendix 2) should be reviewed by the consultant in charge of care and a copy placed in medical records along with a completed 'Checklist for patients refusing blood and blood components' and NHS consent form.

Any additional information should be recorded in the medical records and signed by the patient and speciality consultant in charge of care (4).

These documents should be filed in the "Red Alert" section at the front of the medical notes.

6.3.5 On admission to hospital

It is essential that the speciality consultant in charge of care re-confirms the treatment plan with the patient and makes a contemporaneous entry, signed, timed and dated on both the 'Checklist for patients refusing blood and blood components' and NHS Consent form.
The patient should have the opportunity to reconsider their treatment decision(s) (2).
Should a patient disclose on the day of admission that they would decline blood or blood components for a procedure where there is a risk of bleeding; consideration should be given to rescheduling the procedure in order to allow adequate preparation and discussion.

6.3.6 Intra operative management

All relevant issues should be highlighted at the time of the team brief and during the surgical safety checklist before the start of anaesthesia.

Tranexamic acid should be administered intravenously if not contraindicated and Cell Salvage considered for all surgical procedures if blood loss >500 ml is possible/likely.

The treatment or intervention should be supervised by the surgical specialty Consultant and Consultant Anaesthetist in charge of the patient's care. In the event of heavy bleeding, immediate guidance from a Consultant Haematologist should be sought. Early pre-operative consideration should be given by consultants for the speciality, anaesthesia and haematology to one or more of a number of techniques to reduce intra operative blood loss (2).

This may include:-

- Patient positioning, which can influence the amount of pressure and subsequent blood loss from the operative area.
- Techniques to maintain or restore normothermia, e.g. fluid warmers and heated mattresses.
- *Controlled hypotension may be considered*
- Maximising tissue oxygen delivery by maintaining:
  - intravascular volume
  - cardiovascular support
  - ventilation and oxygenation
  - use of nitrous oxide and hypercapnia may increase the risk of bleeding
- Minimising oxygen consumption by the use of:
  - Adequate and appropriate analgesia
  - Sedation

  - Mechanical ventilation
- Employing surgical techniques which help prevent blood loss:
  - Use of minimally invasive techniques if possible
  - Use of electrocautery, laser or ultrasonic dissection to minimise blood loss
  - Extra vigilance and lower tolerance for bleeding during procedure
  - Meticulous surgical haemostasis
  - Staged surgery for complex procedures
- Careful estimation and measurement of blood loss during the procedure, and careful recording and documentation of volumes
- Use of intraoperative cell salvage if appropriate (closed system for Jehovah's Witnesses)
- A Surgical specialty Consultant and Consultant Anaesthetist should be in charge of the patient's care and should directly supervise or carry out the treatment/intervention

In the event of heavy bleeding, immediate guidance from a Consultant Haematologist should be sought

The administration of fresh frozen plasma or platelet concentrate is not normally accepted by Jehovah's Witness patients, but cryoprecipitate may be acceptable. Other potentially acceptable therapeutic options include prothrombin complex concentrate, which contains factors 2, 7, 9 and 10, and fibrinogen concentrate. Raising the fibrinogen concentration with fibrinogen concentrate or cryoprecipitate can partially compensate for the effect of a low platelet count on haemostasis. Desmopressin 0.3 lg.kg_1 intravenously may also improve haemostasis by increasing large vWF multimers, and possibly improving procoagulant platelet activity. Recombinant factor 7 should only be considered as a 'last resort' treatment due to the excess of prothrombotic events.

If after consideration and/or use of the intraoperative techniques described above, bleeding cannot be stopped despite all best efforts, the patient should be stabilised as far as possible with fluids and coagulants, and then the patient should be returned to the ward for symptom control.

The patient's family/friends should be made aware of the patient's condition and they should be invited to be with their loved one in the event of there being a high likelihood of death.

6.3.7 Post-Operative Management

A comprehensive verbal and written handover of the patient to recovery, critical care and/or ward staff is essential. They should be made aware of any adverse intra-operative events and should understand and respect the wishes of the patient that have been discussed before the procedure.

Management must include: regular routine post-operative observations and action taken appropriately, as well as careful, close monitoring and documentation of post-operative blood loss. Following surgical procedures that employed a tourniquet intra-operatively there may be excessive blood loss after its release that may continue into the postoperative period. Abnormal bleeding must be reported immediately to the surgical team. A postoperative dose of intravenous Tranexamic acid (1 g) should be considered.

- Maintain strict fluid balance chart
- Restrict phlebotomy to prevent iatrogenic blood loss but careful monitoring of the patients haematological status must not be neglected (consider use of paediatric sample bottles)
- Avoid and promptly treat infections to reduce secondary postoperative haemorrhage

- Iron therapy and stimulation of red cell production if required. It is recommended that iron therapy be maintained for a minimum of three months from restoration of normal haemoglobin values (see appendix 5)

There should be close adherence to any additional surgical, anaesthetic or haematological instructions which should be documented as part of the management plan in the clinical notes (appendix 3).

- **Medical patients**

6.3.8 Patients with anaemia who refuse transfusion

In anaemic medical patients the aim is to maintain a haemoglobin level that achieves the maximum benefit, not just physiologically, but in terms of energy levels and quality of life.
All cases of anaemia should be investigated and treated with appropriate haematinic replacement therapy if a deficiency is discovered.

In haematological conditions seek advice from a Consultant Haematologist and refer Jehovah's Witnesses to the local Hospital Liaison Committee member if the patient wishes.

A plan should be drawn up between the patient and their consultant to cover the range of possible outcomes during day to day treatment.

6.3.9 Medical emergencies (haemorrhage)

Early involvement of the medical consultant responsible for the patient to determine the management plan is essential. Active intervention to investigate and stop bleeding should be considered at an early stage.

The checklist (appendix 3) should be consulted to determine the patient's wishes. If this has been completed at hospital admission, check with the patient (if possible) that they still refuse transfusion, and confer with the on call Consultant Haematologist for advice at the earliest opportunity.

Extra vigilance should be exercised to quantify any abnormal bleeding/coagulopathy due to underlying medical conditions or medications, and to detect complications, as promptly as possible. A Consultant Haematologist should be involved immediately after abnormal bleeding has been detected.

Intravenous crystalloid and artificial plasma expanders should be used for fluid replacement. Consideration should be given to the use of tranexamic acid.

The patient and family must be kept informed about the situation and they should be given information in a professional manner and their wishes respected at all times.

Where a patient lacks capacity and is unable to give/withold consent to transfusion doctors should act in their best interests, taking into consideration the advice in section 5.1 relating to advance directives.

- **Obstetric Patients**

Pregnant women who are Jehovah's Witnesses, or who refuse transfusion of blood components or blood products for whatever reason, should be identified early, ideally when they first present to antenatal services. Pregnant women should be asked at the time of their booking appointment whether they would accept the transfusion of blood components or products (including anti-D). If they decline, they should be referred for Maternity Team care and a detailed discussion will need to take place regarding options and risks. The woman will be classified as "high risk" and a Consultant Obstetrician and a Consultant Anaesthetist should be involved and an individual management plan developed. It is recommended that these women give birth in a Consultant-led unit.

The same legal principles as apply to the general population regarding consent for transfusion are applicable to pregnant women over the age of 18 years, and for those under 18 years of age, the principles described in section 5.1.2 apply. There is no special consideration given in English law to "the rights of the foetus" in these circumstances. Detailed management guidance is given in the SFHT document "Management of women in pregnancy who decline blood and blood products guideline"

- **Neonates**

The legal principles that are applicable to children who are too young to give informed consent will also apply to neonates (see section 5.1.2). If the baby's parents object to it receiving a transfusion and time permits, medical staff should apply via the courts to resolve the issue. In a life-threatening emergency, doctors must provide treatment in the neonate's best interests, which may include giving a blood component/product transfusion even if this is against the wishes of the parent(s).

If the family are Jehovah's Witnesses, the Jehovah's Witness Hospital Liaison Committee is available to help with advice and guidance. These discussions along with the parents at ward level can often resolve difficulties and avoid costly court referral.

6.4 Other considerations

6.4.1 Stress and anxiety for staff

Doctors, nurses and midwives have an obligation to do the best for their patients. It can be difficult and stressful when the use of treatments which could reduce morbidity or even save the patient's life is limited because of conflict with the patient's wishes or religious beliefs. It can be especially difficult when these limitations contribute to a death which might otherwise have been avoidable.

A clinician may refuse to participate in an elective procedure if he or she feels that the patient's request is unreasonable or inappropriate. The reasons should be explained to the patient. An attempt should be made to refer the patient to a suitably qualified colleague
When a patient death or near death occurs, the effect on staff members may be profound. Full briefing of all members of the expanded team can avoid feelings of frustration and anger which may be directed at the patient, their relatives or representatives. Counselling may be required for staff who may feel that, because of adhering to the patients expressed wishes, they have been unable to provide an optimal level of care that has resulted in a significant morbidity or even death during their care (2).

6.4.2 Ethical Dilemmas

Working within restrictions imposed by patients who refuse blood or blood products can result in diversion of hospital resources from other patients who have a medically indicated need for them. Examples are significant periods in ITU or HDU, or temporary dialysis. (2)

6.5 Contacting the local Jehovah's Witness Hospital Liaison Committee

The local Hospital Liaison Committee is contactable over 24 hours and will advise on all issues relating to the care and treatment of a patient who is a Jehovah's Witness.

See appendix 1 for contact telephone numbers.

7.0 MONITORING COMPLIANCE AND EFFECTIVENESS

WHAT **element of compliance or effectiveness within the procedural document will be monitored**	**WHO** **is going to monitor this element (job title of person/ group responsible)**	**HOW** **will this element be monitored (method used)**	**WHEN** **will this element be monitored (frequency/ how often)**	**REPORTING** **Which committee/ group will the resultant report and action plan be reported to and monitored by (report should include any areas of good practice/ organisational learning)**
Demonstrate that patient care reflects individual needs as directed by the policy	Hospital transfusion team	Documentation audit	Annually	Results will be presented to the HTC A summary report will be presented to the PSQB
A clear record of the patient's management plan when a blood transfusion is refused	Hospital transfusion team	Documentation audit	Annually	Results will be presented to the HTC A summary report will be presented to the PSQB
Analysis of incidents where there has been a failure to follow procedure	Hospital transfusion team	Datix reports	Quarterly	A summary report will be presented to the HTC and PSQB

8.0 TRAINING AND IMPLEMENTATION

This policy will be disseminated via the Trust intranet.

Education and training with regard to the policy will be covered during mandatory Blood Components Training.

9.0 IMPACT ASSESSMENTS

- This document has been subject to an Equality Impact Assessment, see completed form at Appendix 6
- This document is not subject to an Environmental Impact Assessment

Appendix 2

Advance Decision to Refuse Specified Medical Treatment

1. I, _____ (print or type full name), born _____ (date) complete this document to set forth my treatment instructions in case of my incapacity. **The refusal of specified treatment(s) contained herein continues to apply to that/those treatment(s) even if those medically responsible for my welfare and/or any other persons believe that my life is at risk.**

2. I am one of Jehovah's Witnesses with firm religious convictions. With full realization of the implications of this position I direct that **NO TRANSFUSIONS OF BLOOD or primary blood components (red cells, white cells, plasma or platelets)** be administered to me in any circumstances. I also refuse to predonate my blood for later infusion.

3. No Lasting Power of Attorney nor any other document that may be in force should be taken as giving authority to disregard or override my instructions set forth herein. Family members, relatives, or friends may disagree with me, but any such disagreement does not diminish the strength or substance of my refusal of blood or other instructions.

4. Regarding end-of-life matters: [initial one of the two choices]

   (a) _____ I do not want my life to be prolonged if, to a reasonable degree of medical certainty, my situation is hopeless.

   (b) _____ I want my life to be prolonged as long as possible within the limits of generally accepted medical standards, even if this means that I might be kept alive on machines for years.

5. **Regarding other healthcare and welfare instructions** (such as current medications, allergies, medical problems or any other comments about my healthcare wishes):

_____

Appendix 3 - Checklist for patients refusing transfusion (including Jehovah's Witnesses)

Patient's Name: _____ Consultant: _____

Hospital number: _____ Department:__ _____

Date of birth: _____ Today's Date: _____

Does the patient have an Advance Decision covering refusal of blood components? YES / NO.

Treatment	Action	Further information
Is your patient taking: aspirin, NSAIDs, warfarin, other anticoagulants/antiplatelet agents, e.g.clopidogrel, prasugrel, dabigatran, apixaban, edoxaban or rivaroxaban?	YES / NO / N/A	Date to stop:
Have you corrected any anaemia pre-operatively, e.g. with iron, B12, folic acid (if appropriate)?	YES / NO / N/A	
Have you started patient on Tranexamic Acid?	YES / NO / N/A	
Has Consultant Anaesthetist been informed?	YES / NO / N/A	
Has Consultant Haematologist been informed?	YES / NO / N/A	

	I accept				I accept		
	YES	NO	Not Discussed		YES	NO	Not Discussed
Red blood cells				**Acute Normovolaemic Haemodilution**			
Platelets				**Intra-op Cell Salvage**			
Fresh Frozen Plasma				**Post-op Cell Salvage**			
Cryoprecipitate				**Fibrin glues and sealants (human)**			
Albumin				**Fibrin glues and sealants (non-human)**			
Recombinant clotting factors (rVIIa)				**Anti-D**			
Prothrombin Complex Concentrate (PCC)				**Other treatment (specify):**			
Fibrinogen concentrate							

If required to save my life:	
Red Cells:	**YES / NO**
Platelets:	**YES / NO**
Fresh Frozen Plasma (FFP):	**YES / NO**
Cryoprecipitate:	**YES / NO**

(If so place a copy in the patients' medical notes behind the red alert notification page)

- The patient (parent/guardian) has confirmed understanding and agreement with all the statements made above.
- The patient (parent/guardian) has also confirmed understanding that this document will remain in force and binding to all those involved in his/her care until he/she personally revokes it either verbally or in writing.
- The patient (parent/guardian) is signing the relevant document of his/her own free will.

Patient (parent/guardian) signature _____ **Name** _____ **Date**_____

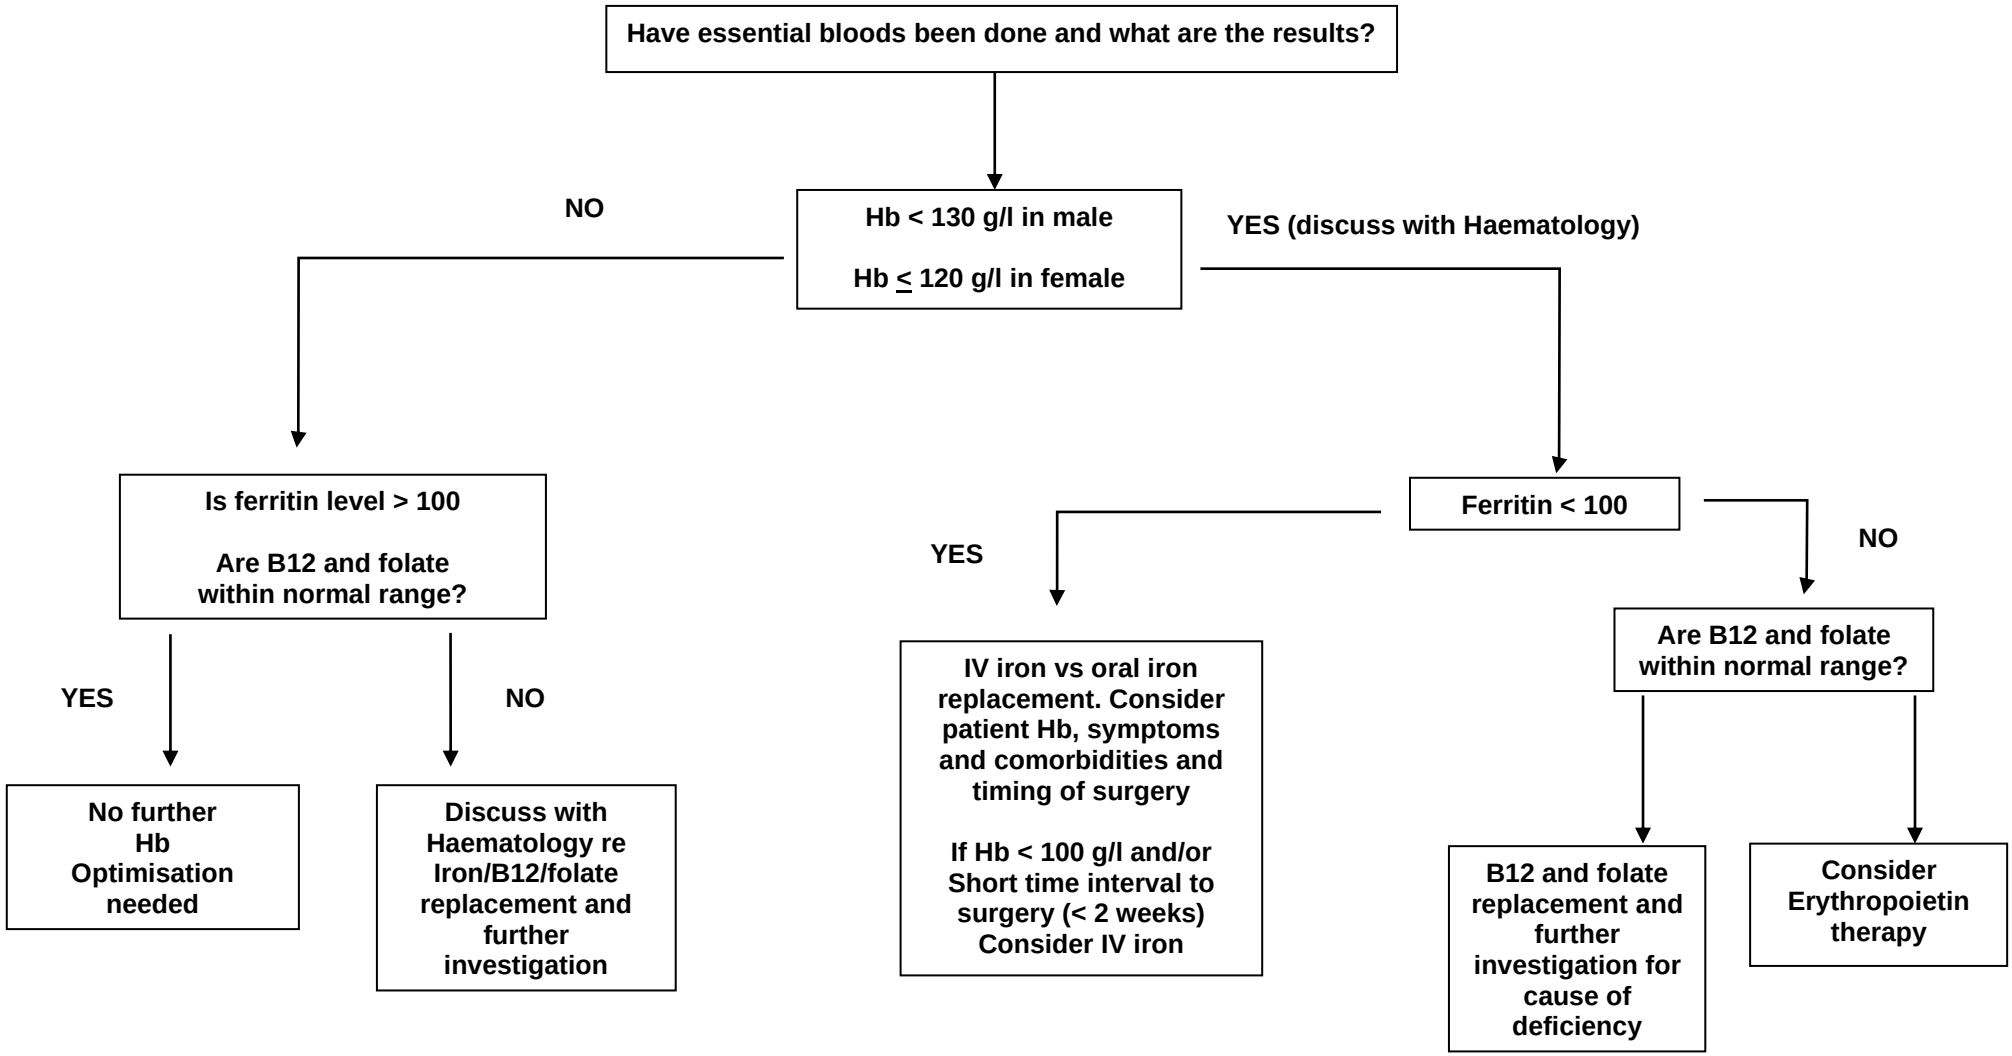
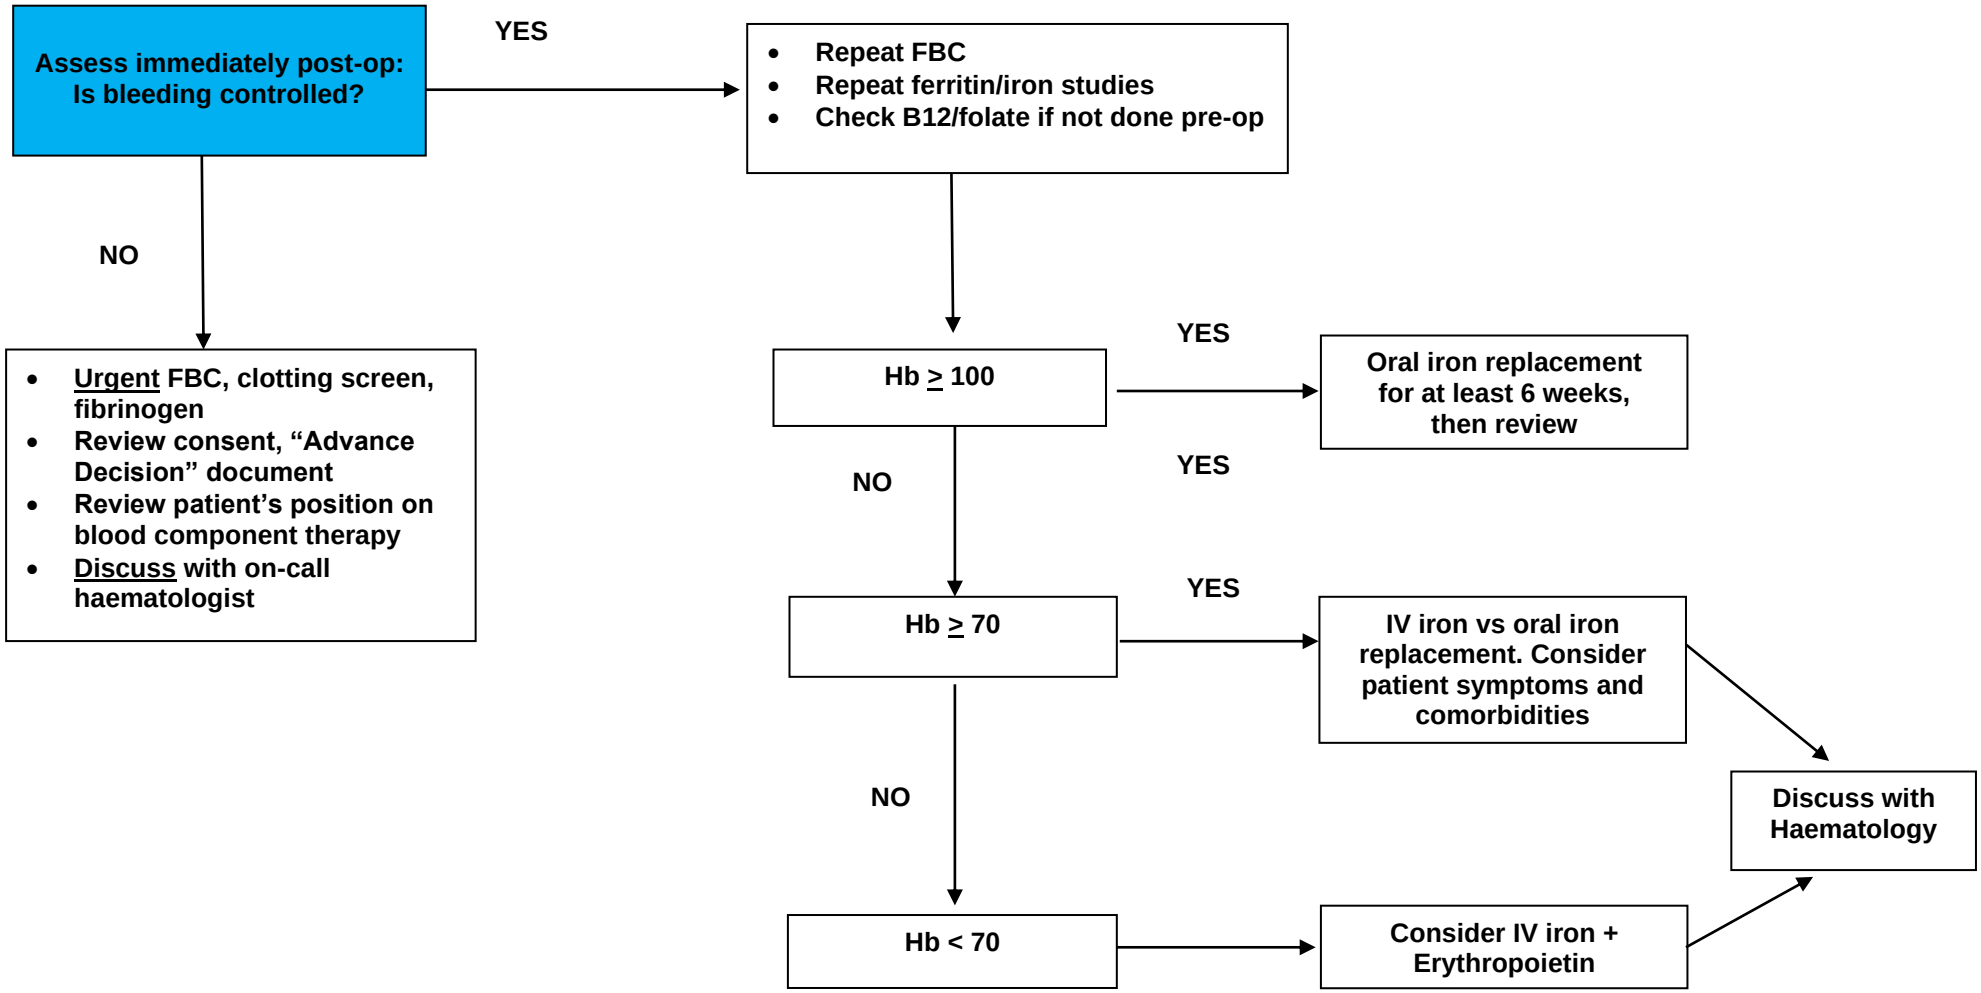
Appendix 4

Pathway for pre-operative anaemia management of adults refusing blood and blood component transfusions



Appendix 5 – Pathway for post-operative anaemia management of adults refusing blood or blood component transfusions



APPENDIX 6 - EQUALITY IMPACT ASSESSMENT FORM (EQIA)

Name of service/policy/procedure being reviewed: Policy for refusal of transfusion of blood and blood components			
New or existing service/policy/procedure: Existing			
Date of Assessment: 30.07.20			
For the service/policy/procedure and its implementation answer the questions a – c below against each characteristic (if relevant consider breaking the policy or implementation down into areas)			
Protected Characteristic	a) Using data and supporting information, what issues, needs or barriers could the protected characteristic groups' experience? For example, are there any known health inequality or access issues to consider?	b) What is already in place in the policy or its implementation to address any inequalities or barriers to access including under representation at clinics, screening?	c) Please state any barriers that still need to be addressed and any proposed actions to eliminate inequality
The area of policy or its implementation being assessed:			
Race and Ethnicity	None	None	None
Gender	None	None	None
Age	None	None	None
Religion	None	None	None
Disability	None	None	None
Sexuality	None	None	None
Pregnancy and Maternity	Not covered in policy	Already a Trust guideline for the management of women in pregnancy who decline blood and blood products	None
Gender Reassignment	None	None	None
Marriage and Civil Partnership	None	None	None
Socio-Economic Factors (i.e. living in a poorer neighbourhood / social deprivation)	None	None	None

What consultation with protected characteristic groups including patient groups have you carried out? • Consultation has occurred with the local hospital Jehovah's witness representatives.
What data or information did you use in support of this EqIA? •
As far as you are aware are there any Human Rights issues be taken into account such as arising from surveys, questionnaires, comments, concerns, complaints or compliments? • No

Level of impact From the information provided above and following EqIA guidance document: http://sfhnet.nnotts.nhs.uk/content/showcontent.aspx?contentid=49233 please indicate the perceived level of impact: Low Level of Impact For high or medium levels of impact, please forward a copy of this form to the HR Secretaries for inclusion at the next Diversity and Inclusivity meeting.

Name of Responsible Person undertaking this assessment Dr Swe Win Maung (Consultant Anaesthetist)
Signature:
Date: 30th July 2020
