

INFORMATION FOR PATIENTS, RELATIVES AND CARERS

The safe use of bed rails

It is the Trust's intention to keep people in their care safe. While sometimes the use of bedrails can help, there are also risks attached to the use of bedrails. The risk between using bed rails and not using them has to be a balance for each person, using the skills and judgement of the health professional in discussion with the person/family/carer. A risk assessment will be carried out before the use of any bed rails.

What are bed rails?

Bed rails are a frame that are attached/integral to the bed. Some bed rails may be covered in padding or a 'bumper'. They are used for:

- When people are being taken to another area on beds or hospital trolleys.
- When recovering from an anaesthetic, procedure, or sedation.
- To offer extra support when sitting up.

They may be considered for:

- When a person's balance or safety in bed is affected by illness, condition, or medicine.
- At the person's request to give a feeling of security. They should still be able to move in bed and always have the call bell in reach to be able to ask for help when getting out of bed.

Please note:

- Not everyone is suitable for bed rails.
- Trying to get out of a bed with bed rails can cause greater injury; please ask for help before transferring from the bed.
- Bedrails cannot/should not be used as a form of restraint.
- Bed rails are kept in good condition and regularly checked for safety. If there are concerns at any time, these should be reported to a member of staff.
- The need for bed rails will be reviewed regularly. This may result in them no longer being needed and as a result, they will be kept in the down position on the bed. Any change in use of the bedrails should only be as a result of a further assessment by healthcare staff.

If you have any concerns about this information please speak to a member of staff.
