

INFORMATION FOR PATIENTS

Esotropia (an inward turning eye)

This leaflet explains what esotropia is and what treatment your child may need.

What is it?

Esotropia is a squint in which one eye turns inwards towards the nose.

Is there any treatment?

Treatment for this type of squint involves careful monitoring of the squint and the vision in the squinting eye. If your child needs glasses these will be prescribed.

When one eye is squinting (turning) this can affect the vision in that eye. It may cause the eye to become lazy and reduce the vision (amblyopia).

If the squinting eye becomes lazy, your child may need to wear a patch to improve the vision in the lazy one (for further information please see the occlusion/patching leaflet). The patch will help to improve the vision only in the squinting eye and will not improve the appearance of the squint.

If your child's squint alternates (changes from one eye to the other), this often means that neither eye has become lazy, as each eye is straight for some of the time.

The size of the squint will also be monitored. If the squint size is stable and the appearance is cosmetically good, just observation alone will be required.

If the squint is very noticeable, the doctor may decide an operation to help straighten the eyes should be considered. Sometimes this can be deferred until your child is older, so accurate measurements can be made and vision improved by any necessary patching treatment.

If there is binocular vision potential, i.e. your child's eyes could work together as a pair to gain depth perception, early surgery may be advised.

Your child may need to attend the eye clinic regularly for several years to allow monitoring of the squint and for appropriate treatment to be carried out

Contact details

If you have any queries please ring the Orthoptic Department:

King's Mill Hospital

01623 622515, extension 3365 or 6655 Monday to Friday, 9am-4pm.

Newark Hospital

01636 681681.
