

INFORMATION FOR PATIENTS

Upper or high tibial osteotomy

What is a high tibial osteotomy?

This is an operation to realign your leg and reduce the pain that you have from your knee. This procedure does not return the knee to normal. It prolongs the life of a damaged knee and delays the need for total knee replacement.

Why is an osteotomy needed?

Osteotomy can be useful in younger, more active patients whose arthritis is at an early stage and only in one part of the knee joint. Realigning your knee and leg will shift your weight off the damaged side of the knee. This will help to relieve your pain, improve your function and delay the progression of the arthritis.

Are there any alternative treatments?

- Do nothing.
- Take painkillers.
- Use a walking stick.
- A knee brace may help some patients.

What can I expect after the surgery?

- Day case or 1 night stay in hospital.
- You will be seen in outpatient physiotherapy within 2 weeks.
- You will need to walk with crutches for up to 6 weeks.
- You will not be able to drive for up to 6 weeks.

How long will it take to heal?

- The wound takes 2 weeks to heal.
- It may take several months for the bones to heal.
- It could take up to 1 year to feel the full benefit of this operation.

When will I be seen in clinic?

- 2 weeks after operation to check the wound and remove any stitches.
- At 6 weeks after surgery with an x-ray.
- 3 months post operation with x-ray.

What are the risks of this operation?

- Anaesthetic risks.
- Infection.
- Blood clots.
- Swelling.
- Nerve damage/ numb scar.
- A stiff knee.
- Delayed bone healing. Smoking can double the amount of time it takes for the bones to heal.
- Anterior knee pain.
- Need for further surgery in the future such as removal of metalwork and total knee replacement.

Useful contact numbers:

- Treatment room, Clinic 1: Telephone 01623 622515, extension 4110.
- Specialist nurses: Telephone 01623 622515, extension 4104 (or ask switchboard to contact bleep 4104) or call mobile number 07585980527.
