

INFORMATION FOR PATIENTS

Post-surgical epidural advice

Epidural analgesia can provide excellent pain relief following surgery.

Complications can occur, but are rare. These can be caused by bleeding or infection into the spine. Although rare, early intervention/treatment is vital to stop permanent damage so it's important to look for signs whilst the epidural is in and after it has been removed. Problems may occur days or weeks after removal.

Whilst in hospital, the epidural is monitored by the ward nurses and by the pain specialist nurses on a regular basis. This is to ensure effectiveness of the pain relief, but also any complications associated with it.

Your epidural was inserted on:

Your epidural removal was on:

Once discharged

We recommend that if any of the following symptoms occur you should seek urgent medical advice via your GP and inform them that you have had an epidural post-surgery.

These are:

- Persistent/worsening redness/swelling at the site.
- Persistent fever (temperature/sweats/shakes).
- Any discharge from the epidural site.
- Altered sensation in legs/arms, such as numbness/tingling or weakness/inability to bear weight.
- Difficulty in passing urine/incontinence of faeces.
- Any intense headaches which worsen on sitting upright and ease on lying flat.
- Any neck stiffness.

Please also be aware of any potential pressure area damage (a sore area of skin that develops due to pressure on it and lack of movement), for example on heels or buttocks, and seek medical advice if any occur.
