

Left head turning preference:

- Turn your baby's cot so they have to look to the right to see you.
- Place visual stimuli on their right (toys, TV, etc.) to encourage them to look that way.
- Turn your baby's head to the right when they are sleeping.
- Encourage tummy time, encourage them to lift their head and look to the right.
- When your baby is awake, try putting them on their right side. You may need to put something behind them to stop them rolling back.
- If bottle fed, hold them with their head on your left arm to encourage them to look to their right for their bottle.
- When holding your baby against your shoulder, place them on your left to encourage them to look to the right.
- Use a baby sling sometimes instead of a car seat/buggy to avoid constant pressure on one side of their head.

INFORMATION FOR PARENTS, GUARDIANS AND CARERS

Paediatric Physiotherapy

Plagiocephaly and head turning preference

What is plagiocephaly?

If you have noticed that your baby is developing a flat spot on the back or side of their head, it could be due to a head turning preference and a sign of plagiocephaly.

As babies' skulls are soft, they are prone to being 'moulded' into a flat shape if they spend a long time lying in the same position. Your baby's ear may be pushed forwards on the flattened side and the face may be asymmetric.

Possible causes

- Tight neck muscles – your baby may require stretches, which your physiotherapist will teach you.

- Sleep position – if your baby always lies in the same position when they are asleep, it can cause flattening to one side of the head.
- Prematurity – babies that are born too early have softer skulls, making them more prone to flattening.
- Lack of tummy time – it is essential all babies experience being on their tummy while they are awake and supervised, at least every day. It is recommended however, that all babies sleep on their backs.
- Car seats – try to use only when your baby is actually in the car.

What can I do?

Encourage your baby to be in different positions so their head is not always lying in the same position.

Right head turning preference

- Turn your baby's cot so they have to look to the left to see you.
- Place visual stimuli (toys, TV, etc.) on their left to encourage them to look that way.
- Turn your baby's head to the left when they are sleeping.
- Encourage tummy time; encourage them to lift their head and look to the left.
- When your baby is awake, try putting them on their left side. You may need to put something behind them to stop them rolling back.
- If bottle fed, hold them with their head on your right arm to encourage them to look to their left for their bottle.
- When holding your baby against your shoulder, place them on your right to encourage them to look to the left.
- Use a baby sling sometimes instead of a car seat/buggy to avoid constant pressure on one side of their head.
